Contents of this report have been approved by the World Agricultural Outlook Board, and the summary was released March 1, 1984. Materials may be reprinted without permission. *Agricultural Outlook* is published monthly, except for the January/February combined issue. Price and quantity forecasts for crops are based on the February 13 World Agricultural Supply and Demand Estimates.

Annual subscription: \$34.00 U.S., \$38.50 foreign. A 25-percent discount is offered on orders of 100 copies or more to one address. Order from the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402. Make check payable to Superintendent of Documents. Allow 6 to 8 weeks for delivery.

Current subscribers will receive a renewal notice from the Government Printing Office approximately 90 days before their subscription expires. The notice will be sent **ONLY ONCE** and should be returned promptly to ensure uninterrupted service.

In Brief. . . News of Farm Income, Consumer Spending, the Sub-Saharan Drought

Current prospects indicate that farm income this year will probably be more evenly distributed among commodity lines and regions of the country than during 1983, when the drought caused unusual income disparities. Net farm income, which includes cash and non-cash income and expenses, is forecast at \$31 to \$36 billion, up from the \$20 to \$22 billion estimated for 1983. Higher commodity prices, delayed disbursements from the 1983 PIK program, and the greater value of crop inventories will offset steeper farm production costs.

The farm sector's financial position in 1984 will likely be about the same as last year. Consequently, it will probably be better than in 1981 and 1982. Because of rebounding cash expenses, net cash income is expected to slip to \$37 to \$41 billion, compared with the \$41 to \$43 billion estimated for 1983. Thus, cash flow could be tighter for some farmers this year. Some producers continue to need liquidity to pay interest and principal on outstanding loans.

The February survey of intended plantings showed that acreage of many crops will climb from a year earlier, nearing pre-PIK levels. Prospective plantings are up for cotton (35 percent), feed grains (17), food grains (8), and oilseeds (3).

The meat output forecast for this year is 1 percent below 1983's record. Signup for the dairy diversion program was smaller than expected, so dairy

cow slaughter will not increase as much as earlier anticipated. Red meat production may drop 2 percent, but this decline will be partly offset by a 1-percent rise in poultry.

U.S. exports this fiscal year may total \$37.5 billion, 8 percent above 1983, mainly because of sharply higher prices for corn and soybeans. However, export volume could slide from 144.8 million tons last year to 140 million—15 percent below the fiscal 1980 record of 163.9 million. Corn, wheat, and cotton volumes are expected to surpass a year earlier, but oilseeds may drop. The agricultural trade surplus is forecast at \$20.5 billion, up almost \$2 billion from fiscal 1983.

Consumer expenditures for domestically grown food (excluding fishery products) could rise 5 to 7 percent in 1984. Last year, they came to \$312 billion, up 4.3 percent from a year earlier. Almost all the increase went to higher marketing costs; the farm value of food consumed edged up only slightly. Marketing costs accounted for 73 percent of consumer expenditures for food. The rise expected this year in retail spending will come from a 4- to 5-percent boost in real disposable income, a 4- to 7-percent increase in food prices, and growth of nearly 1 percent in the U.S. population.

Drought slashed agricultural output over much of Sub-Saharan Africa last year, raising the region's import needs for 1984. Moreover, the dry spell apparently has lingered into 1984 in Southern Africa. U.S. agricultural exports to the Sub-Sahara, both commercial and food aid, may pass \$1 billion in fiscal 1984. This total would represent a 25-percent jump over 1983, although it would still fall under the peak \$1.3 billion in 1981. Because of the drought, South Africa—traditionally a major competitor in world corn markets—has become a net importer of corn. Nigeria, the region's biggest agricultural importer, may expand 1984 purchases from the U.S. by 12 percent, mostly wheat and corn.

Agricultural Economy

Conditions in the crop sector have improved, mainly because of reduced 1983 production. Demand for farm commodities is expected to grow in the months ahead, although supplies of most major crops will probably increase as producers respond to higher prices and plant more acres. Total meat production is expected to be below last year's record level. Red meat production is forecast to be slightly less than last year and poultry production slightly more. The world economic recovery will likely boost demand for U.S. agricultural goods, so farm income—and overall financial conditions of the sector—should benefit.

Disposable Income Rising, But Recovery Uncertain After 1984
U.S. real disposable income may increase 4 percent in 1984—1 percentage point more than last year's rise. This will buoy consumer demand for food and beverages by about 2.5 percent, other things being equal. Not all of the increase will go to the farm level, of course. Nevertheless, the recovery is expected to give farm-level demand the biggest lift in 5 years.

Beyond 1984, the outlook for the recovery is clouded by large Federal deficits. Continued high real interest rates would gradually put a brake on economic activity again, undercutting farm product demand.

The recently released money supply targets for 1984 would modestly tighten growth of the money supply. M-1's expansion is targeted at 4 to 8 percent; its actual growth was 9.6 percent in 1983. M-2's target was set at 6 to 9 percent, compared with its actual growth of 11.8 in 1983. By limiting the funds available for credit, this tighter money supply could contribute to higher interest rates, a stronger dollar, and weaker domestic and export demand for farm products, particularly in 1985. However, a tighter money supply would be less inflationary, helping to keep a lid on the rise in farm costs.

U.S. agricultural exports during fiscal 1984 are expected to total \$37.5 billion, 8 percent above 1983. Most of the increase is due to higher prices for corn and soybeans, since total volume will likely drop to 140 million tons, a decline of 3.3 percent from last year. This would represent the fourth consecutive year of falling export volume—a total 24-million-ton slide from the record in fiscal 1980. The largest decline is in the oilseed complex. The agricultural trade surplus is expected to be \$20.5 billion this fiscal year, up \$2 billion.

World economic growth will probably reach 3 percent in 1984, up from the 1.9 estimated for 1983. This expansion is still below trend because of high interest rates, the strong dollar, and continuing credit problems. If foreign countries had experienced trend income growth between 1982 and 1983, U.S. exports of grains and soybeans might have been 10 million metric tons higher for that 2-year period, other things being equal. American exports are not expected to pick up substantially until 1985, and improvement is contingent upon a continued strong world recovery.

Crop Acreage and Production Costs Moving Up

Acreage of major crops will rebound in 1984. Annual meat production may go down about 1 percent from 1983, with output above last year in the first half but then declining below the large drought-induced volumes of last sum-

mer and fall. In the second half, pork production will likely be sharply lower and cattle feeding will be moderately reduced. But poultry output should expand to compensate for some of the drop in red meat. For the year, poultry production will slightly outstrip 1983.

Production expenses could increase by 6 to 8 percent in 1984. Input use may near 1982 levels and prices paid may rise 4 to 6 percent. Production expenses actually declined in 1983, by about 3 percent, mainly because of PIK. In the late seventies, expenses rose an average of 11 percent per year.

Farm costs are as much linked to the U.S. and foreign economies as farm demand is. As agriculture uses more nonfarm inputs, production expenses increasingly move with inflation and interest rates. A slowing in inflation kept prices paid by farmers for nonfarm inputs to a 2-percent rise in 1983—the smallest in a decade. These prices are forecast to rise 3 to 5 percent in 1984. At recent levels of production expenses, a 1-percentage point increase in inflation will generate about a \$1.5-billion advance in farm production expenses. Since inflation is forecast to go up by 1 to 2 percentage points in 1984, farm production expenses could see a \$1.5- to \$3.0-billion increase solely due to inflation.

During the past 20-plus years, U.S. agriculture has become increasingly dependent on debt financing. During 1960, interest expenses were 5 percent of production expenses; during 1983, they were 15 percent, or \$21 billion. Given existing conditions, a 1-percent change in the average interest rate on outstanding farm debt would cause a \$2-billion change in farm production expenses. Interest rates are expected to rise about 1 percentage point by the close of 1984, but the average rate on farm debt will rise somewhat less because of maturity distribution.

The rising value of the dollar has both hurt and helped the U.S. farm sector. Because of appreciation in the dollar, an estimated \$6 billion has been lost in U.S. export sales over the past 2 years. But, the appreciation of the dollar has also reduced the general inflation rate by 2 to 4 percentage points. Thus farmers benefit in lower prices for imported fertilizer, chemicals, and farm machinery—and competing domestic inputs.

Net Farm Income To Improve

Net farm income for 1984 is forecast to be \$31 to \$36 billion, up from the \$20 to \$22 billion estimated for 1983. Higher commodity prices, 1983 PIK disbursements, and the greater value of crop inventories will offset steeper farm production expenses. Because of rising cash expenses, net cash income is expected to drop to \$37 to \$41 billion, compared with the \$41 to \$43 billion estimated for 1983. Consequently, cash flow could be tighter for some farmers this year. Some producers continue to need liquidity to pay interest and principal on debts.

Financial strategies for the farm sector show a shift to conservative management. Total farm debt declined by 0.5 percent in 1983 because of the PIK program and related reductions in CCC loans. Some farmers sold equipment and land to avoid being delinquent on loans. Growth in gross capital investment in 1984 is expected to be modest—investment may move \$3 billion above 1983's \$19.1 billion. Nominal real estate values may gain 3 percent for the year, but after adjustment for inflation they will likely decline. Farm debt is forecast to rise 3 percent. Nominal farm equity is expected to rise only 2.8 percent—in real terms, a decline for the fourth consecutive year. [Linwood A. Hoffman (202) 447-7340].

LIVESTOCK HIGHLIGHTS

•Cattle

The number of cattle marketed in January from the seven major feeding States declined 4 percent from a year ago. The drop was largely due to poor weather through mid-January. At the same time, the cold forced large numbers of cattle off pastures, particularly wheat pastures, into feedlots. The number of cattle placed on feed was 13 percent above a year earlier in December, and 5 percent above in January. Placements in Texas rose 56 and 48 percent in December and January, respectively, from year-earlier levels.

The first profits since last spring and lower-than-expected grain prices were added incentives to move the cattle forced off pasture into feedlots rather than to slaughter. Fed cattle market-

ings are expected to increase through early spring; good weather since late January has improved weight gains. The larger feedlot placements in December and January will put spring marketings up near last spring's levels.

The sign-up for the dairy diversion program in 1984-85 was below expectations. However, producers participating in the program indicated they would cull about 340,000 more dairy cows than normal through March 31, 1985. Nonfed slaughter is expected to remain high through early spring. Increased dairy cow slaughter, together with larger beef cow slaughter due to poor hay and other forage supplies, will raise cow slaughter to almost 2 million head this quarter, compared with 1.7 million a year ago. The largest monthly increase in dairy cow slaughter occurred in January, when nearly 80,000 more dairy animals than normal were sent to packinghouses. Total cow slaughter in January rose 127,000 head from a year earlier. Cow slaughter is expected to remain above a year earlier through spring. However, beginning with the spring grazing season, beef cow slaughter and nonfed steer and heifer slaughter will probably drop sharply.

Beef production this winter may surpass a year ago by about 4 percent. Spring output will be near the seasonally high levels of a year earlier. With beef production large, cattle prices likely will not return to late January's \$68.50 per cwt until spring or early summer. Declining supplies of competing meats this spring, plus a reduction in beef supplies in the second half, probably will support cattle prices in the upper \$60's this spring and summer. Prices are likely to slip back to the mid-\$60's in the fall as meat supplies rise seasonally.

Expected higher feed costs through spring should hold prices for yearling feeder steers near those for fed cattle. However, lower grain prices in the second half, particularly next fall, may raise feeder cattle prices to a premium

over fed cattle. Prices for lighter weight stocker cattle should remain strong throughout 1984, supported by prospects for good grazing conditions, higher cattle prices in 1984/85, declining grain prices, and smaller feeder calf supplies.

Utility cow prices are expected to remain in the mid- to upper \$30's until spring grazing begins and beef cow slaughter declines. Prices should average in the lower \$40's this spring and near \$40 in the second half. They are expected to be bolstered by strong demand for stocker cows, and reduced supplies of processing meats due to lower culling rates associated with the young beef cow herd. [Ronald A. Gustafson (202) 447-8636]

•Hogs

Hog prices are being pressured by abundant supplies of pork and beef, after averaging near \$50 per cwt from mid-December to early February at the seven major markets. Prices will be pressed further as slaughter rates rise seasonally in late winter. Prices for first-quarter 1984 are expected to average \$46 to \$49 per cwt, compared with \$55 a year earlier. As production declines seasonally, probably starting in mid-April, prices may rise, going into the low \$50's by late spring. For the second quarter, they could average \$47 to \$51, compared with \$47 last year.

Although producers' returns greatly improved in late fall and early winter, they remain below breakeven. But, sow slaughter as a percentage of total slaughter has dropped, indicating that the sharp liquidation that began last summer has ended. The breeding herd inventory is expected to be relatively stable during the next few months. If current hog price projections are realized and lower feed costs appear likely by next fall, producers may begin expanding the breeding herd in late spring or early summer, even though feed prices may spike upward in the next few months. Also, spring farrowings may be above December 1 intentions, which indicated a 5-percent drop.

Commercial pork production this quarter is estimated at 3,750 million pounds, up 8 percent from a year ago. The average dressed weight is projected near last year's 172 pounds. However, slaughter is projected higher

¹Commercial production ²Federally inspected slaughter, certified. ³Farm production; marketing year beginning Dec. 1. ⁴Total production.
⁵Forecast for latest quarter.

than would be expected from the December 1 inventory of market hogs weighing 60-179 pounds, because producers probably will not be holding back as many sows as in 1983. In first-quarter 1983, because producers were building up the breeding herd, sows accounted for only 4.2 percent of slaughter—compared with 5 percent for the previous 5 years.

Commercial production in the second quarter is expected to be about 3,675 million pounds, down 1 percent from a year earlier. Hog slaughter in the spring is projected to be about the same as a year before. Because of high feed costs, the average dressed weight may average 1 to 3 pounds lighter than spring 1983's 174. If prospects

for a large corn crop continue, producers may begin retaining gilts to increase the fall pig crop, thus lowering slaughter in the second quarter. [Leland W. Southard (202) 447-8636]

•Broilers

First-quarter 1984 production continues to be forecast at 2 percent less than 1983's 3.059 million pounds. There are some indications that producers would have set more eggs if they had been available. The extreme cold at the end of December may have reduced the rate of lay. In addition, cumulative placements of pullets were below a year earlier. Spring production

may be down 1 percent from 1983. In the second half, production will likely increase.

Reduction in supplies and more news of avian flu kept prices strong in the first quarter. The twelve-cities price may average 60 to 63 cents per pound, up from the nine-cities average of 43 in 1983. With continued reduced supplies, prices in the second quarter may average 57 to 61 cents, compared with 46 last year.

After expanding output in first-half 1983, producers slowed second-half production to about the same amount as in 1982. As a result, total broiler meat output in 1983 from federally inspected plants totaled 12,382 million pounds ready-to-cook, up 3 percent from 1982. Birds slaughtered numbered 4,130 mil-

lion head, 1.5 percent more than in 1982. Weights averaged 4.08 pounds, compared with 4.04 the year before.

Broiler producers added fewer replacement pullets to the hatchery flock during 1983. For the year, replacement pullets were 4 percent below 1982. In first-half 1984, pullets placed 7 to 14 months earlier will be 5 to 6 percent below 1983. Thus, producers will likely hold old hens slightly longer to gain additional hatching eggs. [Allen J. Baker (202) 447-8636]

•Turkeys

With strong grain prices and prospects for more red meat in first-half 1984, turkey producers have reduced hatchery activity for January-May marketings. From September 1983 through January 1984, placements of poult for domestic slaughter were 1 percent below a year earlier. In addition, turkey eggs in incubators on February 1 numbered 3 percent less than a year earlier. Thus, turkey meat output in the first half may drop 3 to 4 percent from 1983.

Expectations of weaker grain prices as harvest approaches and reduced red meat supplies are brightening prospects for returns. Consequently, hatchery activity for second-half 1984 production is expected to increase.

During 1983, output of turkey meat from federally inspected plants totaled 2,563 million pounds, up 4 percent from 1982. A larger percentage of heavy breed turkeys was placed. The number of turkeys increased 3 percent, and average weights (live weight) were up 0.3 pounds to 19.53.

The low quantities of frozen turkeys in storage, reduced production, and the uncertainty caused by avian flu kept prices strong during January and February. In January, 8- to 16-pound hen turkeys in New York averaged 72

cents per pound, up from 54 last year. Prices this quarter are expected to average 66 to 69 cents per pound, up from 55 last year. With supplies in the second quarter reduced, the average may inch up a penny; second-quarter prices last year averaged 57 cents. [Allen J. Baker (202) 447-8636]

•Eggs

Boosted by smaller supplies and worries over avian flu, January prices of cartoned Grade A large eggs in New York averaged 115 cents per dozen, up from 63 in 1983. Reports on the number of layers destroyed imply a much greater reduction in production capability than is actually the case.

A comparison of the number of layers on hand this year with those last year suggests that producers outside the quarantine area have compensated for losses in the area. The layer flock as of December 1, 1983, totaled 4 percent less than a year earlier. Layers on January 1, 1984, numbered only 3 percent below a year earlier, despite the fact that the largest destruction of layers because of the flu occurred during December. Farmers offset the flu losses by cutting the number of old hens sold. Egg production per hen was down in December chiefly because the older hens were not as prolific in that period.

Producers did not begin to increase pullet orders until last December, when the hatch was 10 percent above a year before. These chicks will not enter the laying flock for 5 to 6 months and so will not affect egg production until mid-1984. Thus, even with continued holding of old hens, egg production this quarter could be 4 percent below the 1,433 million dozen produced in 1983. During the second quarter, production may fall 3 percent from 1983's 1,405 million dozen.

Prices for eggs will likely remain strong. This quarter they may average 103 to 107 cents per dozen, up from 66 last year. Second-quarter prices are expected to slip to 88 to 92: the second-quarter 1983 price was 69 cents. [Allen J. Baker (202) 447-8636]

•Dairy

Milk production this year is expected to decline 3 to 5 percent from 1983's record 140 billion pounds, because of the dairy diversion program. The 37,888 participants in the program signed up for a total diversion of 9.4

billion pounds over the 15-month period that ends March 31, 1985. Because the program allows a 3-percent variation from the base, the total marketings diverted could range from 8.1 to 10.3 billion pounds.

Milk production in 1983 was 3.1 percent larger than a year earlier, the result of 2.3 percent more output per cow and 0.8 percent more cows. However, the first month in the diversion period, this January, saw milk production about unchanged from a year earlier. Cow numbers declined 82,000 from December 1983 to January 1984 and were slightly below a year earlier. January output per cow was about the same as a year earlier.

Cow numbers are expected to decline further in 1984, pushing the yearly average about 3.5 percent below 1983. Much of the drop will come from participants in the diversion program, but some nonparticipants may also reduce their herds because of lower returns and higher costs. Output per cow is expected to be about unchanged. Some participants will obtain part of their contracted reductions by lowering output of their cows, and this should offset the usual increases in average output.

Commercial disappearance of all milk and dairy products (milk equivalent, fat-solids basis) was weak during most of 1983. However, a gain of more than 3 percent during October-December put total disappearance for 1983 about 0.3 percent higher than a year earlier. The gains in 1984 probably won't be as strong as in fourth-quarter 1983, but use is anticipated to move up 1 to 3 percent. The expected increase will be the result of a lower support price for milk, which will help hold down retail prices of dairy products; the improving economy; and the national dairy product promotion program, which will start later this year.

With lower milk production and higher commercial disappearance, USDA purchases will likely fall in 1984. Net

purchases totaled 16.8 billion pounds (milk equivalent, fat-solids basis) last year, up 17.7 percent from 1982. For 1984, purchases are expected to decline nearly one-half. However, even with the lower purchases, USDA uncommitted inventories of dairy products will remain very large. [Clifford M. Carman (202) 447-8636]

CROP HIGHLIGHTS

•Wheat

The 1984 U.S. wheat harvest is very likely to surpass the 2.4-billion-bushel 1983 crop. First, an increase of 2.4 million acres has been reported for 1984 winter wheat acreage. Second, fewer spring wheat growers may participate in Government programs than 1983's 95 percent.

The potential size of the 1984 crop will become clearer after farmers complete enrollment in the 1984 acreage reduction (ARP) and payment-in-kind (PIK) programs. The acreage intentions report provided some indication of spring wheat farmers' participation plans as of early February. Out of a total base of about 25 million acres, farmers indicated plans to seed 17.7 million acres of Durum and other spring wheat.

Overall participation prospects were given a boost with the extension of the signup to March 16 and a relaxation of rules for summer fallow farms. About 25-30 million acres are typically planted in rotation with summer fallow. Since fallow land can qualify as conservation acreage, 1.5 to 3.0 million additional acres may be withheld from wheat production in 1984.

The forecast of world wheat production and consumption is relatively similar to January: records are expected for both output and use, global ending stocks may increase slightly, and world prices remain low. Notable changes in export and import commitments have occurred, though.

An increase in Australia's output has added to its record exportable supply and to an expected record stock level. Over a quarter of the Australians' wheat is reportedly weather damaged, but they hope to export most of it by offering big price discounts. India, usually a customer of Australia, has yet to purchase wheat from there, but has purchased significant quantities

elsewhere. Argentina has sold most of its exportable surplus this year, with the USSR as its largest customer and Brazil as the second largest. Argentina made its first sales ever to Mexico and Tunisia this year, but China has bought no Argentine wheat so far this season, after purchasing 3 million tons last year.

The USSR's total wheat imports are expected to be 20 million tons. The forecast was raised a million tons in February because of large commitments to date. The Soviets recently made additional purchases from all of the major exporters. Egypt and Brazil are also expected to import more wheat than earlier forecast.

The Chinese are now expected to take 1 million tons less wheat in 1983/84 than earlier forecast, for a total of 11 million. U.S. sales to the Chinese so far this year have been disappointing, despite their announcement that they will purchase and take delivery this year of both the annual 6-million-ton minimum specified in the U.S.-China agreement and the 1983 agreement shortfall. [Allen Schienbein (202) 447-8444 and Bradley Karmen (202) 447-8879]

•Rice

The 1983/84 average price for rice is expected to be between \$8.50 and \$9.00 per cwt. This range reflects anticipated takeover of rice by the Commodity Credit Corporation (CCC), as well as PIK marketings of lower quality medium grain rice. For the first 5 months of the marketing year, farm prices averaged \$8.63 a cwt, 49 cents above the loan rate.

About 25,000 producers received a deficiency payment of \$2.77 per cwt for participating in the 1983 acreage reduction program. Payments reached about \$250 million.

With the 1984-crop target price set at \$11.90 per cwt and the loan rate at \$8.00, the 1984 acreage reduction program is likely to attract high participation for the second consecutive year. A 25-percent cutback in acreage is required for benefit eligibility. Without

a PIK provision in the program, planted acreage will probably be substantially higher than last year's 2.2 million acres, but it is not likely to exceed 1982's 3.2 million. Expectations of weak demand and prices are likely to prompt enough participation to keep acreage close to 3 million. During early February, farmers indicated plans to seed only 2.82 million acres.

World rice production has reached a new high in 1983/84 because of continued expansion in area and yields. A record amount of rice will also be consumed. Global rice stocks have steadily fallen from the 1978/79 peak because of declines in two Asian countries: Japan, which has intentionally reduced its rice surplus, and India, which has experienced increased demand and several relatively poor crops.

India has purchased substantial quantities of rice this year, becoming a significant net importer for the first time since the early 1970's. Forecast imports of over 600,000 tons should replenish depleted Government stocks. India recently purchased 200,000 tons of rice from Thailand, and additional sales are likely. These rice imports may displace some expected wheat imports.

Since 1979, world rice exports have been within 1 million tons of 12 million. The U.S. export market share is usually over 20 percent, but it has fallen below this proportion for 1983/84 and will likely stay below next season as well.

Thailand and Pakistan have made inroads into the U.S. share recently because record crops in both countries have reduced their prices. U.S. prices, supported by the loan rate, have made U.S. rice less competitive. The large gap between foreign and U.S. prices will be maintained in 1984.

[Barbara C. Stucker (202) 447-8444 and Bradley Karmen (202) 447-8879]

•Feed Grains

Stocks as of January 1 imply a smaller supply of corn for the remainder of the marketing year than originally expected. However, the market does not appear to be convinced: corn prices have declined. Consequently, corn use has been running at rates that supplies cannot support. Moreover, lower prices may prompt livestock producers and feeders to make decisions that will further tighten the supply this summer.

Corn exports continue on track with the export forecast of 1,875 million bushels, and food, seed, and industrial use is currently forecast at 950 million bushels for the marketing year. With the index of livestock numbers equaling a year earlier, total January-March disappearance of corn may be close to 2 billion bushels. This would leave about 2.9 billion for April 1 stocks—200 million less than April-September disappearance last year. Consequently, April 1 stocks will be a key indicator of the corn supply situation.

Wheat feeding continues high, particularly in the Central and Southern Plains, and likely will stay above year-earlier rates during spring and summer. The average price received by farmers for all wheat during June-September was below the national loan rate in only 3 of the last 14 years—1977, 1982, and 1983. The differential between the loan rate and farm price for these 3 years averaged 16 cents a bushel, but in 1983, when the corn crop was short, the differential was 12 cents. If wheat is substituted for corn in the Corn Belt, Lake States, and Northern Plains next summer, the cost of wheat at the feedlot would reflect the price plus transportation and handling costs. Consequently, the cost of wheat at the feedlot would likely support the price of corn.

Another price factor is the size of the 1984 crop. In early February farmers indicated plans to seed 81.8 million acres to corn, in line with expectations. This figure implies a participation rate of 40-50 percent in the corn program. Such acreage, with a trend yield, would produce an 8-billion-bushel crop. Consequently, prices could weaken

next fall, but 1984/85 carryover stocks would not be excessive, and season-average prices would likely be above the loan rate.

The estimate of world coarse grain production for the 1983/84 marketing year was lowered 1.6 million tons to 687 million in February. The drop from 1982/83 global production is 14 percent, with the United States accounting for all of it.

Foreign coarse grain production is estimated at 548.8 million tons, slightly less than previously expected, but still 20 million larger than last year. Foreign output was bolstered by near-record production in the Soviet Union (estimated at 108 million tons) and Argentina (19.1 million), and record production in China (90.0 million) and Australia (9.3 million). Both the major importers and major foreign exporters are expected to produce more than last season.

The Brazilian crop estimate was decreased 700,000 tons in February because hot January temperatures stressed the corn during its reproductive period. Production prospects for Zimbabwe and the Sudan have also declined. The biggest change, though, has occurred in South Africa's outlook. The crop there is expected to be so small that this traditional exporter is likely to continue depending on imports to meet its domestic needs.

For further details on the coarse grain situation in South Africa, see the special article in this issue. [Larry Van Meir (202) 447-8776 and Jim Cole (202) 447-8857]

•Soybeans

Soybean acreage is forecast to rebound in 1984. In early February, farmers indicated plans to plant 65.2 million acres, up from 63.5 million in 1983. Nevertheless, this was below expectations and may reflect the decline in soybean prices relative to corn during the last 6 months and higher-than-expected participation in the wheat program in the South, where soybeans

are double-cropped with wheat. Final plantings will depend on soybean prices relative to other crops and actual compliance rates in the corn, wheat, and cotton programs.

Because of smaller-than-expected stocks on January 1, disappearance during January-August 1984 will have to be nearly 20 percent below a year earlier to provide the projected carryover of 150 million bushels. Thus, prices should rise in the coming months in order to ration use. Price rallies will also be affected by the South American crop and by the outlook for U.S. production. Soybean prices in Central Illinois averaged \$7.46 a bushel in January and slipped to around \$7.00 by mid-February. The season-average farm price is projected to be \$7.50 to \$8.20 a bushel.

Domestic crush may reach 985 million bushels during 1983/84. Crush during October-December was 273 million, lowest for the quarter since 1978. Soybean exports were 211 million bushels for October-December, the lowest since 1980. Exports for the season are expected to reach 725 million bushels.

This season's domestic soybean meal use is likely to fall 9 percent to 17.5 million short tons, because of declining animal numbers. Soybean meal prices (Decatur) averaged \$201 a ton in January and are expected to average about \$210 for the season. Although soybean meal exports reached 1.88 million tons during October-December—a strong quarterly performance—exports for the season will likely be about 6 million tons, a sixth below last season.

U.S. soybean oil production is forecast at 10.9 billion pounds. Production is higher than expected earlier because oil yields are averaging over 11 pounds a bushel—0.3 pounds above normal. Domestic use may be 9.6 billion pounds and exports 1.6 billion. Soybean oil prices in January averaged 28.3 cents a pound. They are projected to average between 26 and 30 cents for the season.

World oilseed production for 1983/84 is estimated at 166 million metric tons. Argentine soybean and sunflowerseed estimates were increased 0.5 million tons during February. The USSR's sunflowerseed crop has deteriorated be-

cause of poor weather; it is likely to be 5.1 million tons. World oilseed output is 8 percent less than a year earlier, while soybean output is 15 percent less.

Most of the increase in the Argentine soybean crop will be put into stocks and exported during the 1984/85 marketing year. Argentina does not use much soybean meal domestically. Currently, it is expected to export 2.5 million tons of beans and 1.7 million tons of meal in 1983/84. These exports represent 74 percent of the country's total supplies.

World soybean oil use is expected to be up less than 1 percent from 1982/83. India may import 400,000 tons of soybean oil, since it is in greater supply than palm oil. Pakistan will raise imports because of the poor cottonseed output there. Although most Pakistani purchases are under U.S. P.L.-480 programs, some cash buying is likely. The USSR may require more soybean oil because of the decline in the sunflowerseed crop.

The increase in Argentina's sunflowerseed crop will dramatically boost the country's exports of seed and oil in 1983/84. The Argentines are expected to export 300,000 tons of sunflowerseed, and already have sold 187,000 tons to Mexico, traditionally a U.S. market. The Argentine prices appear to fall below those of the U.S. Argentina is also likely to sell to Portugal. Together, these various sales will pull Argentina's share of the world sunflowerseed market from 1 percent last season to 19 percent in 1983/84. The U.S. share, meanwhile, will drop from 70 to 40 percent; U.S. sales will likely fall by 55 percent, to 0.6 million tons. (Roger Hoskin (202) 447-8776 and Jan Lipson (202) 447-8855)

• Cotton

U.S. farmers intend to plant about 10.8 million acres of cotton this spring, according to the February Planting Intentions report, compared with 8 million planted in 1983. The report indicated participation in the 25-percent

acreage reduction program would be high—70 percent or more. Because farmers tend to idle their less productive land, 1984 yields could be relatively large, depending on weather conditions. However, given yield uncertainty, production in 1984 could range from 10.0-12.5 million bales, which would be below this season's forecast total use of 12.6 million. Thus, it appears that acreage will rise, but not so much as to push supplies to the burdensome levels seen in recent years.

Mill use of cotton, at seasonally adjusted rates, declined in December to 5.8 million bales, but bounced back sharply in January to 6.4 million, the highest since June 1980. Mill use is expected to total 5.8 million bales for 1983/84.

Domestic consumption of cotton—mill use plus net cotton textile trade—reached 7.8 million bales in 1983, the highest since 1973 and up 1.3 million from 1982. Foreign mills use a higher proportion of cotton in their blends than do domestic mills, so textile imports, which have been increasing, have raised the supply of cotton available at retail.

U.S. exports of cotton are booming and may reach 6.8 million bales in 1983/84. At seasonally adjusted annual rates, exports have been accelerating since February 1983. They averaged 7 million bales during November 1983-January 1984.

The U.S. is expected to capture over 35 percent of world trade, up from 28 in 1982/83. Production problems have limited supplies of major competitors, especially Pakistan, Brazil, the USSR, India, Egypt, and Mexico. In fact, the USSR and Pakistan, normally the largest competitors, have begun to import U.S. cotton and are likely to be among the 10 largest markets for the U.S. Further, some traditional customers are dramatically increasing the U.S. share of their market from a year earlier: Japan, from 42 to 58 percent; Indonesia, 57 to 75; Italy, 10 to 35; and France, 7 to 19.

Foreign demand for U.S. cotton this season may also be helped by improving world economic activity. However, U.S. supplies may soon be relatively short in some staple lengths and quali-

ties, making unlikely any further significant increase in the 1983/84 U.S. export estimate. [Terry Townsend (202) 447-8444 and Edward W. Allen (202) 382-9820]

• Peanuts

Consumption of domestic edible peanut products is forecast at 2,075 million pounds (in-shell basis) for 1983/84, up slightly from a year earlier. Peanut exports, including edible and oilstock peanuts, are forecast at 700 million pounds, about 3 percent above last year. The export forecast is in line with the August-December rate of exports, which was up 3 percent from a year earlier. Average farm prices for 1983/84 are expected to be \$500 per ton, or 25 cents per pound, about the same as last season.

Contracting of additional peanuts for the 1984 crop must be completed by mid-April. If producers do not negotiate a contract, the loan rate becomes their minimum price. The loan rates for 1984 crop are the same as for 1983. For further details, refer to the Agricultural Policy section of this issue.

Intended acreage in 1984 is 1.4 million, unchanged from 1983, based on a grower survey taken around February 1. The provisions of peanut legislation are such that farmers' planting decisions are largely influenced by their poundage quota; most of the variation in acreage results from export expectations, which determine the amount of acreage planted to nonquota peanuts. Additional influences include price supports and competition from other crops for the use of land and resources.

The effective poundage quota for 1984/85 is 1.25 million tons. With yields averaging about 1.37 tons per acre, about 900,000 acres should make the quota. If farmers plant according to reported intentions, nonquota acreage will probably reach 500,000, producing about 800,000 tons of non-quota output. Most of these peanuts will be exported; however, some will enter the domestic edible market. [Jorge Hazera (202) 447-8444]

•Tobacco

The basic marketing quota for burley tobacco has been reduced by 10 percent for the 1984 crop year. However, the effective quota is 10 percent larger than last year because of unused quota that can be carried over. Kentucky-Tennessee fire-cured quotas were increased. Dark air-cured allotments were essentially unchanged, and cigar allotments were reduced. During early February, farmers indicated plans to seed 794,000 acres of tobacco in 1984, about 11,000 above 1983.

Auction sales for the 1983 crop have ended or are near completion for most kinds of tobacco. Flue-cured and burley prices were both lower than a year earlier—flue-cured was down about 1 cent a pound and burley about 3 cents. Large supplies, poor quality, and reduced cigarette consumption are causing the reduction. Prices for dark fire-cured and dark air-cured tobacco have been up, however. The smaller crop, strong demand for snuff, and increased exports of fire-cured have hiked dark tobacco prices.

Tobacco production in 1983 totaled 1.41 billion pounds (640,000 metric tons), 29 percent below 1982. All types of tobacco were down, with burley and dark air-cured showing the sharpest percentage declines—42 and 39 percent, respectively.

Because of weak demand, U.S. exports of unmanufactured leaf dropped from 697 million pounds (farm sales weight) in 1982 to 630 million pounds in 1983. Exports of Maryland and Kentucky-Tennessee fire-cured gained, but flue-cured, burley, dark air-cured, blackfat, and cigar types declined. Asian takings fell significantly. U.S. exports could decline further in 1984.

Total duty-paid imports of unmanufactured tobacco (for consumption) and machine-threshed leaf jumped 30 percent in 1983, to 527 million pounds. The record import figure exceeded export volume for the first time last year, primarily because of a duty re-

classification. Increases in cigarette, cigar, and machine-threshed leaf much more than offset a reduction in scrap and stems. [Verner N. Grise (202) 447-8776]

•Fruit

Further assessment of the December freezes in Florida and Texas has led to another reduction in the citrus forecast. On February 1, prospects pointed to a crop of 11.0 million tons, down 5 percent from the January 1 forecast and 18 percent from 1982/83. Smaller harvests than last season were estimated for all citrus fruits.

The U.S. orange crop is expected to be 177 million boxes, 4 percent less than forecast on January 1 and 21 percent less than the 1982/83 crop. Florida orange production is estimated at 118 million boxes, off 9 percent from January 1 and 15 percent from last season. The Texas crop forecast, at 2.23 million boxes, is down 26 percent from January and 61 percent from 1982/83. The California crop—unaffected by the December cold—is expected to be 29 percent below last year's record.

In response to the freezes, f.o.b. prices for Florida early and midseason oranges have been strong, averaging \$7.28 a carton in mid-February, 42 percent more than a year earlier. The smaller California crop has also strengthened fresh orange prices. Combined with rising demand, the smaller supply will keep prices firm throughout the season.

The freeze in Florida also reduced orange juice yields more than estimated in January. The season-average yield is now forecast to be 1.21 gallons per box at 42 degree Brix equivalent. The January forecast was 1.23 gallons, and the prefreeze projection was 1.43. The reduced crop and lower juice yields will mean a significantly smaller pack of frozen concentrated orange juice (FCOJ) than last season. Since carryin stocks were sharply smaller, the total supply of FCOJ will be tight if imports do not increase substantially. FCOJ imports to Florida through February 11 totaled almost 15 million gallons, up 63 percent from a year earlier.

In light of tight supplies, packers have raised list prices several times. The current level is \$5.04 a dozen 6-ounce cans, unadvertised brands, f.o.b. Florida canneries. This compares with \$3.95 both before the freeze and a year ago. Some further modest price rises are likely, supported by continued economic recovery. [Ben Huang (202) 447-7290]

•Vegetables

Grower and retail prices for most vegetables will post moderate gains through mid-1984, because of reduced supplies and higher demand. Anticipated increases in disposable income are buoying demand. The Consumer Price Index for fresh vegetables in 1984 is forecast to average 5 to 8 percent above 1983.

However, from March on, prices of some vegetables may drop from a year earlier—tomatoes, bell peppers, and squash. Wholesale prices for cucumbers probably will not rise, but rather remain less than last year because winter supplies will be heavily supplemented by imports from Mexico.

U.S. harvested acreage for winter vegetables is still expected to be slightly above 1983, with major gains in broccoli, tomatoes, and lettuce. Arizona and California, which produce over half the winter lettuce, increased plantings substantially.

The winter potato crop is estimated at 2.68 million cwt, 22 percent larger than in 1983. Higher 1983 prices prompted a 15-percent increase in acreage, and yields were up 12 cwt per acre. However, winter potatoes are a small part of the total crop, so prices are expected to remain above a year earlier at least until midsummer, when early fall potatoes begin to appear on the market. [Jules Powell (202) 447-7290]

•Sugar

U.S. sugar consumption fell 260,000 tons, raw value, in 1983. This drop was only about half that of the previous year, but it reflects the continued displacement of sugar by high fructose corn sirup (HFCS). On February 9, a major cola company announced that it will now allow up to 75 percent HFCS in its canned and bottled cola, up from 50 percent previously. This decision, if fully implemented, would reduce U.S. sugar requirements about 185,000 tons and contribute to lowering 1984 sugar use to about 8.55 million tons—down 350,000.

U.S. sugar production in calendar 1984 is estimated at 5.8 million tons, slightly above 1983. Production in fiscal 1984 continues to be estimated at 5.6 million tons. Beet sugar output is down about 100,000 tons from fiscal 1983. Cane sugar, estimated at 3 million tons after the December freeze damage, is also down 100,000 tons.

The February Prospective Plantings report indicates that growers intend to plant 1.13 million acres of sugarbeets in 1984, 4.7 percent above 1983. At average yields and sucrose recovery, 2.9 million tons of beet sugar would be produced. Total beet and cane sugar production in fiscal 1985 is forecast at 5.9 million tons.

The domestic price of raw sugar (c.i.f. duty/fee-paid, New York) averaged 21.5 cents a pound in January, the same as in December. Prices were about 22 cents in late February. Wholesale refined sugar prices were stable in fourth-quarter 1983. The U.S. average retail price in January was 36.4 cents, down slightly from the previous month.

January prices eased marginally for 42-percent HFCS but were stable for 55-percent HFCS, which is used for soft drinks. Prices are expected to rise in 1984. Consumption of HFCS continues to be forecast at 3.9 to 4.1 million tons, dry basis, up from about 3.6 million in 1983. [Robert Barry (202) 447-7290]

Farm Income Update

Farm income statistics continue to present mixed but generally positive signals about the well-being of the sector in 1984. Current prospects indicate that farm income will likely be more evenly distributed among commodity lines and regions of the country than during 1983, when the drought caused unusual income disparities. Net farm income, which includes cash and non-cash income and expenses, is forecast at \$31 to \$36 billion, up from the \$20 to \$22 billion estimated for 1983. Higher commodity prices, delayed disbursements from the 1983 PIK program, and a greater value of crop inventories will offset steeper farm production costs.

The farm sector's financial position will likely be about the same as last year. Consequently, it will probably be better than in 1981 and 1982. Because of increasing cash expenses, cash income may drop to \$37 to \$41 billion, compared with the \$41 to \$43 billion estimated for 1983.¹

The sector may be in better shape than during 1981 or 1982 for a number of reasons:

- Nominal net cash income is forecast higher in 1984 than in 1981 or 1982 (real income will be about even with those years), and net farm income may rise to near the record 1973 level;

- Distribution of 1983 PIK commodities will add to this year's farm income;

- Prices received for farm commodities could average 5 to 7 percent above 1983, while prices paid for inputs could rise 4 to 6 percent;

- Farmers have come into 1984 with stronger cash positions, requiring less new debt to finance operations.

Many variables could alter these forecasts as the year progresses. One is weather during the growing season and its impact on output and second-half cash receipts. Also critical is the strength of the developing world economic recovery, especially as it affects interest rates, input prices, and U.S. farm exports. Other factors include farmers' decisions on program participation, acreage planted, and input use; the duration of high poultry and egg prices due to reduced supplies and strong retail demand; and 1983 income statistics (tentative until expense data are available this June), which largely form the base for 1984 forecasts.

1983 PIK Adds to Farm Income This Year

Total cash farm income may move up 4 to 6 percent in 1984. Although an expected 3- to 5-percent rise in cash receipts from marketings will account for most of this increase, direct Government payments (including 1983 and 1984 PIK payments) will again be historically high. While direct payments only accounted for 1.3 and 2.3 percent of total cash income in 1981 and 1982, respectively, they probably came to over 4.0 percent in 1983.

Government payments could constitute an even larger proportion of cash income this year, because many farmers delayed taking title to their 1983 PIK commodities. Direct Government payments (cash plus PIK payments) are expected to total \$7 to \$11 billion during calendar 1984, up from the estimated \$6 to \$8 billion of 1983.

Direct cash payments² during 1984 may come to \$2 to \$5 billion, compared with an estimated \$3.9 billion a year

²Includes payments under deficiency, diversion, disaster, reserve storage, conservation, and miscellaneous programs.

earlier. Deficiency payments will likely account for the majority of cash payments, with wheat payments the most important. Because of light sign-up, dairy diversion payments (most to be financed through the 50-cent assessment on milk marketings) will not be as important in total cash disbursements as earlier anticipated.

The value of PIK commodities (valued at original loan rates) disbursed in 1984 under both the 1983 program and the 1984 (wheat only) program is expected to total \$5 to \$7 billion, compared with \$2 to \$4 billion estimated for 1983. The appeal of 5 months' storage payments, expectations of higher prices later, and tax advantages likely swayed many farmers to delay taking ownership of PIK commodities last year. This delay may have shifted over \$1 billion in PIK entitlements to 1984 farm income.

Cash Receipts To Rise

Cash receipts are expected to advance 3 to 5 percent in 1984, following the small decline in 1983. The rise will mainly reflect higher commodity prices. Crop receipts are forecast to rise 5 to 7 percent; a 5- to 7-percent increase in prices received should outweigh a slight decline in expected marketings. Assuming an absence of weather extremes during the growing season, crop output could rebound to near the strong 1981 and 1982 levels. Such output would likely result in considerably higher marketings during the last half of 1984 than a year earlier, and would nearly offset the drought reduction in first-half volume.

Net CCC loans will not be as important a factor in 1984 cash receipts as they were in 1983. However, new loans could become significant in the fourth quarter if crop output is large and prices fall. Loan repayments (due mostly to PIK) will likely outweigh new loans made during the first half, while the reverse could occur during the latter half.

In 1983, loan repayments outstripped new loans, leaving the net CCC loan value at -\$0.7 billion, compared with the record \$9.1 billion of 1982. Stronger crop prices and loan activity led to heavy withdrawals of regular and reserve CCC loans. Stronger prices also made it unnecessary for most producers to take out new loans on their

¹Economic relationships have become more complex in agriculture. When trying to assess the well-being of the farm sector, one should examine a variety of financial (both income and wealth) indicators, especially this year, when some of the indicators move in different directions.

F = Forecast. ¹ Includes net CCC loans. ² Income from custom work, machine hire, and farm recreational activities. ³ Numbers in parentheses indicate the combination of items required to calculate a given item. ⁴ Value of home consumption of farm products and imputed rental value of farm dwellings. ⁵ Excludes depreciation and perquisites to hired labor. ⁶ Excludes farm dwellings. ⁷ Deflated by the GNP implicit price deflator. ⁸ Deflated by the CPI-U. ⁹ Excludes CCC loans.

1983 harvests, unless they planned to enter grain in the reserve³ or speculate on future prices. The exception was in food grains (wheat, rice, and rye), where low prices relative to loan rates caused significant portions of the 1983 crop to be placed under loan.

³ There is no direct entry into the farmer-owned reserve for 1983 crops. Farmers are first required to take out a regular CCC loan; when that loan matures, they may place the crop under a longer term reserve loan.

Cash receipts for food grains in 1984 are forecast to fall nearly a tenth, as lower wheat receipts more than balance increased rice receipts. Wheat stocks remain substantial (thus the 1984 PIK program for wheat). If another large crop is harvested this year, second-half prices and receipts could slide under a year earlier.

Receipts for feed grains and hay could rise 6 to 8 percent, led by corn and sorghum. Oil crop receipts are forecast to increase a tenth, as strong soybean prices more than counter reduced marketings. Cotton receipts will probably rebound from the decline in 1983—

buoyed nearly a sixth by higher prices. Reduced supplies of fruit, especially citrus, could push prices up and increase fruit and nut receipts 6 to 8 percent.

Cash receipts for livestock and products in 1984 are forecast to rise 1 to 3 percent from the \$71 billion estimated for 1983. Prices received for livestock could rise 4 to 6 percent, more than offsetting reduced marketings. Reduced marketings of red meat, milk, and eggs will not be offset by an increased volume of broilers. Additional culling of dairy cows under the Dairy and Tobacco Adjustment Act of 1983 will add slightly to the supply of beef while reducing milk production. With total livestock output expected to decline from the 1983 record, much of the gain in livestock receipts will depend on continued strengthening in the general economy and consequent improvement in consumers' real incomes and meat consumption.

Cash receipts from red meats are forecast to rise 2 to 4 percent from the preliminary 1983 level of \$41 billion. Hog receipts could increase 5 to 7 percent and cattle receipts 1 to 3. Rising prices are expected to offset reduced marketings.

Stronger prices may push poultry and egg receipts a sixth above last year's preliminary \$10.3 billion. Broiler output will probably increase somewhat, but lower supplies of competing meats and improved consumer demand will help keep prices firm. Egg receipts are forecast to rise nearly a fifth—the strongest increase since 1973; the higher prices resulting partly from flu-reduced supplies will outweigh reduced marketings.

Dairy cash receipts, which rose only \$0.7 billion from 1981 to 1983, may drop 4 to 6 percent—the first decline since 1962. Marketings are expected to fall somewhat because of herd reduction resulting from the dairy legislation, and milk prices could decline slightly from last year's \$13.56 per cwt.

Production Expenses Going Up
Production expenses this year are forecast to increase 6 to 8 percent. Last year they registered their first decline since 1953. Two factors will be important this year. First, input use is expected to rise 3 to 5 percent to just

under the levels of 1982, as acreage planted returns to near pre-PIK levels. Second, prices farmers pay for production inputs could rise slightly more than inflation in the general economy — perhaps 4 to 6 percent.

The increase in prices paid by farmers for all items will be the largest since 1981. Seed prices may jump the most, perhaps more than a tenth, while fuel prices could continue to be a stabilizing influence, increasing just 1 percent. Fertilizer prices, reflecting increased plantings and stronger crop prices, may rise 6 to 8 percent, after falling last year and remaining flat in 1982. Feed prices are expected to increase 5 to 7 percent, going higher in the first half and falling in the second.

Greater plantings could boost outlays for manufactured inputs 10 to 14 percent; outlays likely fell a tenth in 1983. Rising prices will account for most of the 11- to 13-percent increase expected in electricity expenses this year. In 1983, increased use and higher cost per kilowatt-hour caused electricity expenses to rise 10 percent, while most other expenses declined. Expenses for fuel may rise 8 to 11 percent; for fertilizer, 13 to 15; for pesticides — mostly because of greater use — 14 to 16.

Expenses for inputs originating on farms may accelerate 5 to 7 percent from 1983's preliminary \$32 billion. Feed expenses could rise 1 to 3 percent from last year's level; reduced feed use will be offset by higher prices. Purchased livestock expenses could rise 4 to 6 percent, boosted mainly by higher feeder livestock prices. Seed expenses may go up as much as a fourth because of both rising prices and more acres planted; last summer's drought-reduced seed production will result in higher seed prices this spring. Following the 1980 drought, seed prices rose 16 percent. Given the severity of the 1983 drought, seed prices for spring-planted crops could climb that much or more this year.

Interest expenses, which likely dipped slightly in 1983, may advance 5 to 7 percent in 1984. Average debt is expected to rise 3 to 5 percent and average interest rates on the debt could move up 2 to 4 percent. Average debt rose 3 percent in 1983 to \$215.7 billion; the average interest rate on outstanding debt likely fell 4 percent from the 10.45 of 1982. [Gary Lucier (202) 447-2317]

World Agriculture and Trade

EXPORT UPDATE

Prospects for U.S. agricultural exports have improved this year. Fiscal 1984 exports may climb to \$37.5 billion, 8 percent above 1983, mainly because of sharply higher prices for corn and soybeans. However, the volume of exports could slip from 144.8 million tons last fiscal year to 140 million in 1984. The volume forecast would be 15 percent below the 1979/80 record of 163.9 million. Oilseeds will probably drop the most.

The world economic recovery and low ocean freight rates will help U.S. agricultural trade. The Soviet Union and China will probably increase pur-

chases. Exports to Japan will stay firm. But those to Western Europe, Latin America, and Africa will remain weak. Vigorous competition will again characterize the world market, because of large food grain supplies abroad, the strength of the dollar, reduced export credit programs, increased levels of import protection, and continued financial and credit difficulties, particularly in Latin America, which took over 14 percent of U.S. farm exports in 1982/83.

U.S. export volume for the first quarter of the fiscal year saw no change from the comparable 1983 figure. However, the export pace is likely to slow during the last half of the year, because of increased crop production abroad and improved competitor export availabilities, particularly in feed grains and soybeans and products.

Prospects for Individual Commodities

Wheat. — U.S. wheat export volume picked up 23 percent during the first quarter of the trade year, but it may taper off later if U.S. imports by the Soviet Union diminish. Total fiscal year exports are forecast at 37.5 million tons, 2 percent above 1983 but well under the 46 million tons sold in 1981. The U.S. share of the world wheat and flour export market may fall below 40 percent this year, compared with an average of 43 in the 1970's. The two major U.S. markets in 1984 are the Soviet Union and China. China is expected to fulfill its long term grain agreement with the United States this year, and the USSR has already purchased 4 million tons of wheat as part of its agreement.

¹ Includes corn, oats, barley, sorghum, rye, and products. ² Excludes Products.

Feed grains.—U.S. feed grain exports in the first quarter edged 6 percent above a year earlier. Estimates of the marketing year's average corn price were reduced in January, reflecting larger crop production figures and lower-than-expected market prices. The 1983/1984 corn crop was significantly below the preceding year but exports are nevertheless forecast to remain at fiscal 1983's level. Price movements for corn later in the year will depend on the harvest in the Southern Hem-

isphere, U.S. stocks, and the size of 1984 U.S. plantings. Corn export volumes should remain at or slightly above last year's pace, assuming that competitors' supplies change little for the remainder of the season.

Sorghum exports have been moving at a slower pace than a year ago. The 1983/84 sorghum export forecast, 5.1 million tons, is 11 percent lower than 1982/83. The decline can be partly attributed to a dip in Mexican buying from the United States; Argentina has sold at lower prices. In contrast, U.S. barley export forecasts are up this

year—sales to Japan and Eastern Europe should continue. Reduced supplies in the EC and other countries are benefiting U.S. sales.

Soybeans, meal, and oil.—The volume of soybean exports slid 24 percent during the first quarter. Bean and meal sales will likely stay depressed because of prospects for greater production in the Southern Hemisphere. Fiscal year soybean exports are forecast to fall 20 percent. Higher prices for beans and meal in the EC will reduce import demand there; the EC soybean meal/grain price ratio continues to favor domestic grains and compound feeds over imported soybeans and meal. In addition, wheat feeding is up there because of large domestic stocks and a favorable wheat/coarse grain price ratio.

Upward revisions in the Brazilian and Argentine soybean harvests will also spell greater competition for U.S. soybeans. However, U.S. meal exports to Japan, Eastern Europe, and Western Europe should increase this year. Soybean oil exports could also rise because of the shortfall in Malaysia's 1983 palm oil crop. The palm oil shortage is boosting world prices and demand for competing edible oils.

Cotton.—The U.S. share of world cotton exports is projected to increase to 35 percent, from 28 percent in 1982/83. Export volume in the first quarter shot up 27 percent from a year earlier. Larger U.S. exports primarily reflect production shortages in several foreign cotton-producing countries. For example, Pakistan and the USSR, typically U.S. competitors in world markets, have purchased U.S. cotton to supplement their short crops.

Agricultural Trade Balance

U.S. agricultural imports may rise 4 percent this year, to \$17 billion. The increase is primarily due to greater values of coffee, sugar, and cocoa. Weather damage to the Florida citrus crop will also necessitate more imports of concentrated orange juice. Nevertheless, the agricultural trade surplus for 1984 is currently estimated at \$20.5 billion, an increase of almost \$2 billion from fiscal 1983. [Patricia Haslach (202) 447-8841]

Agricultural Policy

1984 PEANUT PROGRAM PROVISIONS

On February 15, USDA announced that support levels for 1984-crop peanuts will be unchanged from 1983. Producers will receive a national average support level of \$550 per short ton for 1984-crop quota peanuts and \$185 per ton for additional peanuts. The Food and Agriculture Act of 1981 requires that the national support price for 1984 quota peanuts equal the 1983 level, adjusted for any growth in 1983 production costs except for land. However, the adjustment cannot be more than a 6-percent rise each year. In determining the 1984 support, USDA estimated that 1983 production costs actually declined from 1982.

Additional loan collateral peanuts from the 1984 crop will be sold by CCC for export edible use at no less than \$425 per ton. Price support rates on additional peanuts are designed to prevent the CCC from suffering losses from the sale or disposal of such peanuts placed under loan. USDA, in making this determination, considers

such factors as the demand for peanut oil and meal, foreign demand for U.S. peanuts, and expected prices for other vegetable oils and protein meals.

EXTENSION OF PROGRAM SIGNUP

The Secretary of Agriculture moved the signup closing date for the 1984 cotton, feed grain, rice, and wheat programs from February 24 to March 16. The 3-week extension allows farmers additional time to finalize crop plans before signing a binding contract.

CHANGE IN SUMMER FALLOW RULES

The summer fallow rules for USDA programs have been changed so that the requirements will be identical to those in the 1983 and previous programs. Prior to this action, idled acreage designated for the 1984 programs could not have been land intended for summer fallow in the current year. Other provisions of the 1984 programs remain unchanged.

[Tom Fulton and Loreen Forester (202 447-4943)]

FINANCING SUPPORT PROGRAMS

Public interest in how Government farm programs are financed has picked up lately, with the recent surge in program expenditures. The following description details major categories of outlays for fiscal 1983 and 1984 (projected), and explains influences on program expenses.

The Commodity Credit Corporation is the financing mechanism used to carry out the programs that support farm income and prices. The corporation's capital stock, \$100 million, is held by the U.S. Government. Under present law, CCC may also borrow up to \$25 billion from the U.S. Treasury to fund its operations.

The activity of the CCC can be measured by two yardsticks: net outlays and losses. Net outlays describes the amount of cash changing hands and is the more commonly used measure. When producers obtain commodity loans, the checks they receive count as outlays. When the producers repay, the repayments are counted as receipts, which offset outlays. Other CCC loan programs finance exports and farm storage facilities.

CCC Net Outlays

Outlay category	Fiscal 1983 (actual)	Fiscal 1984 (est.)
Million dollars		
Net lending		
Commod. loans	8,438	*876
Stor. facility loans	-197	-276
Direct export credit	57	-145
Total	8,298	-1,297
Other outlays		
Dir. payments	3,600	2,196
Producer stor. payments	964	619
Net purchases	2,541	654
Net interest	3,525	1,649
Processing, storage, transport	665	690
All other	-735	2,254
Total	10,560	8,062
All outlays	18,858	6,765

CCC Direct Purchases

CCC also purchases some commodities, such as dairy products, to support prices to producers. It may recover some or all of the purchase price if the commodities are later sold. Other CCC expenditures include direct payments under the deficiency (target price) and diversion provisions; storage payments for grain in the farmer-owned reserve; transportation, storage, and handling costs for the commodities the corporation owns; interest paid to the Treasury on borrowed funds; and expenses for running the programs. At the end of the fiscal year, total net outlays reflect the excess of cash disbursed over receipts recovered. To the extent that outlays are not later covered, they are declared losses. Congress appropriates funds to restore losses each year, so that CCC's line of credit with the Treasury remains intact.

CCC outlays for any fiscal year are generally related to the previous crop year. Thus, fiscal 1983 outlays were primarily for the 1982 crop year. CCC

outlays for fiscal 1984 will result primarily from the provisions of the Food and Agriculture Act of 1981, as amended; the 1983 PIK program; and the 1984 PIK (wheat only).

CCC outlay estimates are updated as the year progresses to account for any program revisions and for changing weather and economic conditions here and abroad. Unusually good or bad weather or changes in world economic conditions can produce large shifts in the budget estimates.

Results for 1983 and Outlook for 1984

In fiscal 1983, CCC's net outlays climbed to a record \$18.9 billion. For fiscal 1984, the Presidential budget released in February projects net outlays of \$6.8 billion. The accompanying table breaks down major outlay categories for the 2 years.

Outlays in fiscal 1983 reflected market pressures that had been building several years. Record grain crops were harvested in 1981 and 1982, producing massive supplies just as the world recession, the strong dollar, and international debt sapped demand. As prices tumbled to commodity loan rate levels, CCC lending rose, a large volume of commodities was held off the market as loan collateral, and incentive to repay the loans and redeem the collateral shrank. Net outlays for commodity loans in fiscal 1983 hit a record \$8.4 billion.

Direct payments (deficiency and diversion) also escalated sharply. Deficiency payments are based on the differences between "target" prices, specified in law, and farm-level market prices during certain periods of the year. Deficiency payments in fiscal 1983 jumped because the target prices rose for the 1982 crops and market prices were low. Advanced 1983-crop deficiency payments also pushed up fiscal 1983 direct payments, and a diversion program for the 1983 crops was required by law.

CCC's net purchases are almost entirely for the dairy program. The CCC buys surplus butter, cheese, and nonfat dry milk at specified prices. In fiscal 1983, it bought about 16.6 billion

pounds, milk equivalent—more than 12 percent of all milk produced.

Producer storage payments are related to the size of the farmer-owned reserve. In fiscal 1983, large volumes of grain were stored under this program.

CCC pays the Treasury interest on the funds it borrows. In fiscal 1983, interest was unusually high for two reasons. One was simply the large amount of program activity. The other was that some interest payments due in fiscal 1982 were delayed until 1983 because the CCC was short on funds.

PIK Program Effects

The PIK program affected fiscal 1983 outlays very little, by using commodities that were already under loan or were in CCC inventory. The funds to pay for the commodities had largely been disbursed before fiscal 1983, or would have been paid out as crop loans in 1983 even without PIK.

The current estimates for fiscal 1984 outlays reflect the effects of the 1983-crop PIK and last summer's drought. With supplies of most commodities much smaller, producers are getting higher prices this year. Thus, commodity loan repayments are estimated to exceed new loans by nearly \$900 million. Sharply reduced farmer-owned reserve quantities should also lower this year's payments to producers for storing grain in the reserve.

Deficiency payments should also go down because of higher prices and lower acreage in 1983. The exception is wheat, which was largely harvested before the drought and therefore continues to suffer low prices. In addition, no paid acreage diversion programs are being offered for the 1984 crops, although a new diversion program is being made available to dairy farmers.

In the storage facility loan program and the direct export credit program, net receipts have increased, showing that repayments on loans made earlier are expected to exceed new loans made. In prior years, program levels were much higher than those projected for fiscal 1984.

The decline in interest outlays projected this year reflects the expectation of lower CCC activity. [W. Scott Steele and Marilyn K. Moore, (202) 447-3396]

Inputs

SUPPLY-DEMAND PROSPECTS FOR PESTICIDES

Pesticide use for the 10 major field crops this year is expected to total approximately 534 million pounds of active ingredients (a.i.), about equal to 1982. Herbicides should account for 82 percent and insecticides for 13. The remaining 5 percent includes desiccants and defoliants, fumigants, fungicides, and growth regulators. Corn is the major use of both herbicides (56 percent) and insecticides (45 percent). Soybeans are second in importance in the herbicide market, while cotton takes the second greatest share of insecticides.

Pesticide supplies for the coming year should be adequate. Manufacturers indicate a total supply (a.i.) of over 600 million pounds of herbicides and 215 million of insecticides. Pesticide prices probably will not change much from last year.

Use of preplant and preemergence herbicides and soil-applied insecticides is largely a function of crop acreage. For the major row crops, 91 percent of the acreage was treated with herbicides in 1982. Acreage for the major row crops in 1984 is projected to return to about

Projected U.S. Field Crop Acreage and Pesticide Use, 1984

Crop	Planted area	Herbicide use ¹	Insecticide use ¹
	Mill. acres	Mill. lbs. (active ingreds.)	
Row crops

Wheat	80.0- 84.0	17	2
Total	104.9- 113.1	36	3
Total, all crops	278.1- 298.3	439	67

¹ Projections are based on the midpoint of anticipated planted acres and 1982 average use per acre. ² Less than 1 million pounds.

1982 levels, so herbicide use this season should be similar to that 2 years ago. Two additional factors that affect in-season use of pesticides are the extent to which farmers make postemergence herbicide applications (because of weed infestations not controlled in the spring) and the size of insect populations during the growing season.

Some of the field crop acreage set aside in the PIK program during 1983 was not treated with herbicides, so severe weed infestations are possible

this year. Early-season herbicide applications will be made on virtually all corn, cotton, rice, and soybean acreage and roughly 45 percent of the wheat acreage. If these applications fail to provide adequate weed control, farmers will be forced to apply additional herbicides after crop emergence, resulting in heavier use than normal.

PIK acreage with plant residue or uncontrolled weeds also provided a better habitat last season for some insects—armyworm, corn rootworm, beetles, cutworm, stalk borer, and wireworm. Farmers should scout their fields more carefully and frequently than usual this coming year and may need to apply more insecticides. The severe winter weather that occurred in some areas, however, could have offset some insect pressure.

Last year's drought caused unprecedented spider mite problems for soybean farmers in the Midwest, especially Illinois. These farmers applied insecticides in record amounts. A return to normal weather should make the spider mites a minor problem this coming season.

ENVIRONMENTAL PROTECTION AGENCY BANS EDB

On February 3, the Environmental Protection Agency (EPA) announced an emergency ban on ethylene dibromide (EDB) use on stored grain and milling machinery. This action followed a suspension last September of the pesticide's use as a soil fumigant. The chemical is a known carcinogen in laboratory animals. Agriculture has used about 20 million pounds of the compound annually in recent years, 95 percent for soil fumigation.

EPA's action means that EDB can no longer be sold or used on stored grain or milling machinery. In addition,

EPA set advisory action levels, recommending that States withdraw raw grain containing any more EDB than 900 parts per billion (ppb), grain products for cooking containing any more than 150 ppb, and finished (cooked) products containing any more than 30 ppb. States may follow these guidelines or set their own. Most have adopted the guidelines. Several States are considering establishing more restrictive standards, however. In some cases, manufacturers have voluntarily recalled products containing EDB residues.

It is unlikely that the EPA guidelines will force the destruction of any treated grain stored on farms, because the EDB will eventually dissipate sufficiently to fall below the 900 ppb standard. However, the contamination will increase storage costs and temporarily reduce farmers' marketing options. Several effective and cost-competitive alternatives to EDB are available to control insects in stored grain.

For milling machinery, alternative chemicals are not effective for spot treatment. Methyl bromide can be used, but the entire facility must be fumigated, or the machinery must be disassembled and cleaned. Without EDB, millers will incur higher costs for insect control, but these are a small part of millers' operating expenses.

On March 2, EPA announced a decision to continue some quarantine uses of EDB on fruit and vegetables. The agency is initiating rulemaking to set a temporary citrus and papaya tolerance of 250 ppb for the whole fruit. This equals 30 ppb allowable residue in the pulp, since most of the EDB is retained in the peel. These tolerances will be revoked on September 1 and the use of EDB on domestic citrus and papaya cancelled. For other fruit and vegetable uses, primarily mangoes, EPA deferred its decision because of the current lack of residue data. EDB use is continued for exports, if the importing country requires it for quarantine purposes. (Herman Delvo (202) 447-8308 and Robert Torla (202) 447-8309)

Food and Marketing

HIGHER PRICED ITEMS RAISE CONSUMER SPENDING

Consumer expenditures for domestically produced foods are forecast to grow 5 to 7 percent in 1984. Major factors are a 4- to 5-percent boost in real disposable incomes, a 4- to 7-percent increase in the retail price of food, and about a 1-percent rise in the U.S. population. However, per capita food consumption is expected to decline slightly, primarily because of decreased meat production.

As disposable income increases, consumers have a tendency to buy more expensive products, such as higher priced meats and convenience foods. They also typically increase the percentage of meals eaten away from home. Both these changes will increase total food spending this year by raising the cost per unit of food purchased.

The farm value of food is expected to increase 2 to 4 percent during 1984, while the marketing bill is forecast to rise 5 to 8 percent. Marketing costs are forecast to equal 74 percent of consumers' expenditures for food, gaining another 1 percent of the total food dollar and continuing a 4-year pattern. The farm value is expected to rise be-

cause of higher prices for livestock, while the marketing bill's rise will likely be caused mainly by inflation.

Labor costs, fuel prices, and the general economy influence marketing bill increases. Labor costs may rise faster in 1984 than last year, since employees are likely to use the better economic conditions to gain larger wage increases. Barring major disturbances in the production and distribution of oil, prices for fuel and energy products should remain fairly steady. The one exception is the price of natural gas, which should rise with further deregulation. An expanding general economy influences the marketing bill by bidding up the cost of paper packaging products and by providing a better environment for firms to pass through price increases to customers.

1983 Food Spending Rise Due to Marketing Cost Increases

Retail spending for domestically grown food (excluding fishery products) totaled \$312 billion last year, up 4.3 percent from a year earlier. Almost all the increase was due to higher marketing costs; the farm values of some products fell, and the overall farm value rose only slightly. Marketing costs accounted for 73 percent of consumer expenditures for food.

Farm Value Rose Little in 1983

As used in the marketing bill series, farm value represents payments to farmers for the farm products equivalent to the products sold to consumers. The farm value of domestically produced foods rose 0.4 percent in 1983, to \$83.6 billion. The increase was small mainly because farm prices were lower for such items as hogs and cattle, fresh fruit, and potatoes. The index of prices received by farmers for food products fell approximately 2.1 percent. The reason that the farm value did not fall with prices received was that farmers marketed a greater amount of food last year. This increase in commodity marketings for human consumption not only kept pace with the 1-percent growth in population, but also raised total per capita consumption about 1 percent.

Food Expenditures, Marketing Bill, and Farm Value: At Home and Away

1983	83.6	66.1	17.5

¹ For domestically produced farm foods. Fishery products and alcoholic beverages are excluded.

Marketing Bill Components: Corporate Profits Up Significantly

The marketing bill for domestically grown foods rose 5.8 percent to \$228.4 billion in 1983. The marketing cost index (MCI), a measure of the prices paid for services and materials used to market food, rose 2.7 percent. The difference between the MCI percentage increase and the marketing bill percentage rise can be attributed to growth in the volume of food marketed, increases in corporate profits not included in the MCI, the continuing shift of sales to the away-from-home market, and the shift to more processed commodities.

Labor.—The largest single component, labor in 1983 accounted for almost 45 percent of the marketing bill. Although labor costs rose 6.2 percent, their share of the marketing bill did not change. The increase in absolute costs was due to three major factors:

- A 3.8-percent rise in the hourly wages of food marketing workers—

¹ Includes supplements to wages and salaries, such as pensions and health insurance premiums. Also includes imputed earnings of proprietors, partners, and family workers not receiving stated remuneration. ² Excludes local hauling charges. ³ Includes business taxes, depreciation, rent, advertising, interest, and other costs.

• A rise of approximately 4 percent in food marketing workers' benefits and supplemental pay. Over the past decade the cost of supplemental pay has risen much faster than hourly wages, largely because of the rapidly growing costs of health care plans.

• An 0.6-percent increase in the number of people employed by food marketing firms. Employment in food stores rose 1.3 percent and that in restaurants 0.8 percent. However, the number of people employed by food manufacturing and wholesaling companies continued to slip, because of new technology and the consolidation of firms that could not afford the high capital expenditures needed to remain competitive.

Packaging.—Packaging took 8 percent of the consumer's food dollar last year. As the second largest component of the marketing bill, packaging made up 10.6 percent in 1983, about the same as a year earlier, but saw an absolute increase of 4.3 percent.

Packaging materials themselves rose only 1.8 percent in cost. The price of oil, a raw material for plastics, was steady. Because of weak demand from other sectors of the economy, paper product prices also rose little. Although glass containers are produced largely with natural gas, their cost actually fell, because of competition among manufacturers.

The remainder of packaging costs' rise was due to increases in the volume of food going through the marketing system, and to a rise in sales in fast food establishments, which are heavy users of packaging materials.

Fuels and power.—Food marketing firms spent \$13.0 billion on fuels and purchased electricity last year. This was an increase of only 4.8 percent, the lowest annual rise in over 10 years. Natural gas prices increased 16.6 percent with further decontrol, but diesel fuel prices dropped 12.1 percent because supplies of oil were plentiful and the recession slowed demand. Electricity rates stabilized in 1983, rising only 2.9 percent, after increasing 10.4 in 1982.

Transportation.—Lower diesel costs and greater competition in both the trucking and the railroad industries helped

to hold transportation cost increases to 4.1 percent, or \$0.6 billion. The transportation component of the marketing bill was \$15.3 billion, 7 percent of the total bill. The cost of transportation has more than doubled over the past 10 years, but it has remained a constant 5 percent of the food dollar.

Corporate profits.—After a weak 1982, corporate pretax profits increased 7.6 percent in 1983, to \$14.2 billion. Profits of food marketing firms take about 5 percent of the total food dollar. Last year, such profits were the fastest growing portion of the marketing bill, as the economy's upturn helped boost consumer food expenditures and as the slowing of inflation held down cost increases. Strong sales in the more lucrative away-from-home market particularly augmented profits. [David Harvey (202) 447-6860]

Upcoming Crop Reporting Board Releases

The following list gives the release dates of the major Crop Reporting Board reports that will be issued by the time the March *Agricultural Outlook* comes off press.

March

U.S. Farm Exports to Sub-Saharan Africa

Drought slashed agricultural output over much of Sub-Saharan Africa last year, raising the region's import needs for 1984.¹ Shortfalls have also developed in some non-drought areas for other reasons, such as seed shortages and war-related disruptions. The drought hit Southern Africa and parts of West Africa the hardest; conditions in the south were the worst in 50 years and possibly in this century. Moreover, the dry spell apparently has lingered into 1984 in Southern Africa.

U.S. agricultural exports to the region, both commercial and food aid, may exceed \$1.0 billion in fiscal 1984. This total would represent a 25-percent jump over 1983, although it would still fall under the peak \$1.3 billion in 1981 (table).

Grain Is Region's Major Import

In the last 2 years, U.S. sales to the region have ranked slightly ahead of those to Eastern Europe, although equaling only about half those to South America. About three-quarters of American farm exports to the Sub-Sahara are grains. The U.S. supplies over 50 percent of the area's growing wheat imports and the bulk of its corn imports, which fluctuate widely with weather and local production. Although the rice market is also steadily increasing, Thailand has passed the U.S. as the leading supplier in the last year by selling at lower prices.

Source: U.S. Foreign Agricultural Trade Statistical Reports.

The region's imports of grain rose dramatically from the mid-1970's through 1981 because of several factors. Per capita food production in Sub-Saharan Africa has been declining over the last 15 years. Meanwhile, demand has been climbing because of high population growth, rising incomes in some countries, rapid urbanization, and increasing preference for nontraditional, quickly prepared foods such as bread and rice. However, since 1981, economic difficulties have driven imports down in some cases. Most countries in the region, even the oil exporters, have had severe foreign exchange shortages and rising debt-service obligations.

Food aid has accounted for over 20 percent of the U.S. farm exports to Sub-Saharan Africa during the last decade. However, the drought drove that proportion to 31 percent in 1983, and the share should be about a third again in 1984. Because of the area's weak commercial import position and growing food shortages, the U.S. is boosting the volume of aid this year, particularly emergency shipments to the most severely affected countries.² Experience shows that food aid recipient countries sometimes improve enough economically with good management to turn into commercial importers.

Although Sub-Saharan Africa comprises some 45 countries, Nigeria and South Africa alone account for about half of American sales. Other significant exports—for Sudan, Somalia, Zaire, Ghana, and other countries—are largely generated by aid, unlike sales to Nigeria and South Africa.

² ERS is currently preparing its annual report on *World Food Aid Needs and Availabilities*, which should be published in early summer.

¹ In this article Sub-Saharan Africa includes all countries in Africa except Morocco, Algeria, Tunisia, Libya, and Egypt.

Uncertainty Clouds Nigerian Outlook

Because of drought in the north of the country, Nigeria's grain crop fell more than 20 percent last year, to an estimated 8 million tons. Root crops grown in the south, especially cassava and yams, were also hurt, cut by 10 to 15 percent. Even before the drought, food supplies were tightening; the drop in oil revenues led the Government to restrict imports beginning in April 1982. In 1984, it appears, Nigeria will import about 3 million tons of grain (wheat, rice, and corn), compared with 2.2 million last year. The U.S. will supply most of the wheat and corn, and Thailand most of the rice.

The most populous country in the Sub-Sahara, Nigeria has long been the region's biggest agricultural importer. U.S. farm exports to the country boomed during the 1970's with the surge in oil revenues; from 1975 to 1982, exports grew an average of 32 percent a year. However, the world recession and the dip in oil prices forced a cutback. U.S. exports in fiscal 1983 dropped by 38 percent, to \$331 million.

Higher food prices and some shortages helped cause a military coup last year. The new Government is trying to hold down prices, and without higher imports this policy could worsen shortages. However, financial and physical limitations on imports preclude a return to the earlier consumption levels. Even after the drought, the projected increase in U.S. purchases would be only a 12-percent hike, to \$370 million. The new Government has not yet clarified its economic policies—what it will do about the nation's debt position and about devaluation. But, resumption of rapid import growth is not likely in the next couple of years.

Corn Exports to South Africa Surge

South Africa's 1983 corn crop reached only 3.9 million tons, 40 percent of normal. Just 2 years ago the country exported nearly 5 million tons. By contrast, in 1983/84, it was forced to virtually halt exports and to begin importing corn—becoming a net importer for the first time in 31 years. Purchases have reached slightly over 2 million tons so far, about 1.3 million from the U.S. and the rest from Argentina. Total corn imports could approach 2.5 million tons. In addition, oilseed imports have risen substantially.

Because of South Africa's shortfall, the United States not only sold corn to a usual competitor, but also picked up some sales to other countries that South Africa could not supply. These include Taiwan and Japan. Besides corn, the U.S. increased sales of oilseeds and products to South Africa, although vigorous competition from Brazil and Argentina held back U.S. sales.

South Africa's 1984 corn crop, now underway, will also be below average; rains have been light and erratic in many areas. USDA's preliminary estimate, made in February, was 6.5 million tons, compared to the 9.5 million that might normally be expected, and the estimate could go lower. Thus, imports should continue for 1984/85. South Africa must also rebuild stocks, which have been run very low.

Drought Boosts U.S. Farm Exports to Sub-Sahara

Since the country generally exports white as well as yellow corn, supplies of white on the world market will probably be tight this year. Zimbabwe, another Southern Africa country hit by drought, will also halt its small exports of white corn this year.

Sales to Region

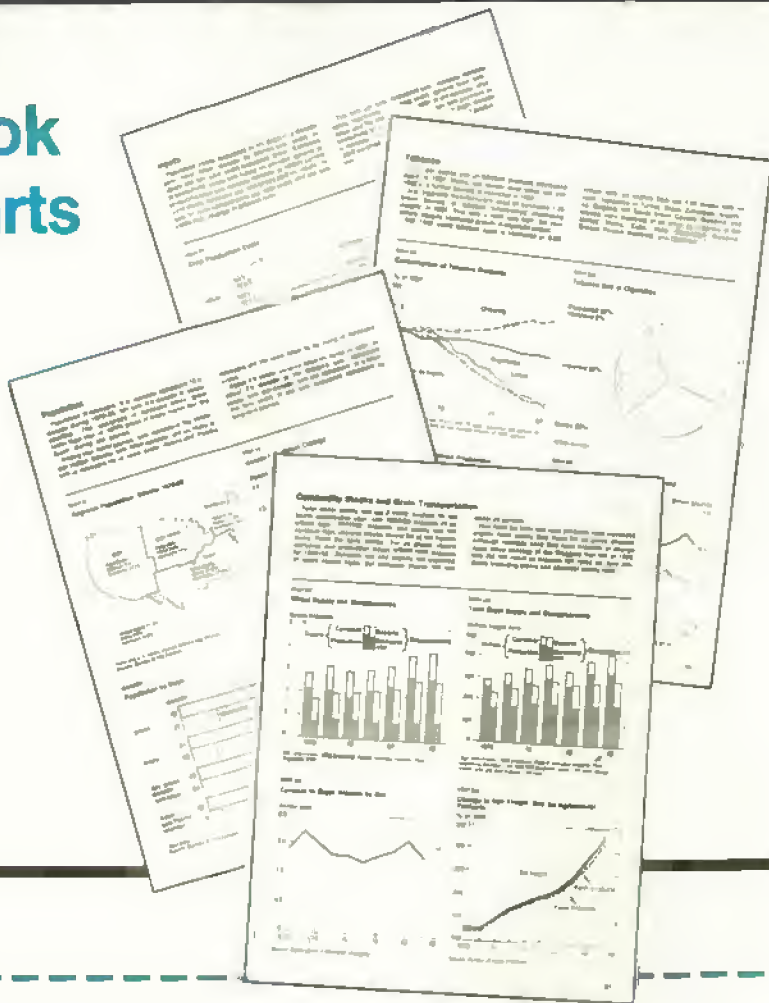

Unlikely To Grow Rapidly

Typically, drought in Africa raises U.S. farm exports, particularly of corn. This was the case in 1981 after East and Southern Africa suffered drought in 1980. Despite the improvement in U.S. exports this year, though, further large increases remain doubtful until world economic recovery boosts the region's export earnings. Even the more prosperous parts of Sub-Saharan Africa are unlikely to achieve strong economic growth in the near future.

For all countries of the region except South Africa, even if domestic production improves substantially in the next few years, pressure on agriculture will remain strong. Nutritional levels are often low and diets are still dominated by cereals and root crops. In addition, as economic development leads to improved diets, accompanying increases in the demand for meat, dairy products, and other more sophisticated products will further tax local production systems and import capabilities. (Peter A. Riley (202) 475-3451)

The 1983 Handbook of Agricultural Charts

Economic and agricultural trends come alive in this two-color handbook, containing 278 charts depicting all significant aspects of agriculture. A valuable research tool, popular teaching device, and convenient format for presenting a complete overview of the agricultural sector. The charts illustrate data and trends for agricultural subjects ranging from farm income to consumer costs, and from commodities to energy production and use. Charts showing trade data, cost of production figures, farmland numbers, and population trends round out the agricultural picture presented in this handbook. A USDA "bestseller." Copies will be available from the U.S. Government Printing Office beginning in December 1983. For your copy, use the GPO order form.

¹ Retail costs are based on indexes of retail prices for domestically produced farm foods from the CPI-U published monthly by the Bureau of Labor Statistics. The farm value is the payment to farmers for quantity of farm product equivalent to retail unit, less allowance for byproduct. Farm values are based on prices at first point of sale and may include marketing charges such as grading and packing for some commodities. The farm-retail spread, the difference between the retail price and the farm value, represents charges for assembling, processing, transporting, and distributing these foods.

Note: Annual historical data on farm-retail price spreads may be found in Food Consumption, Prices and Expenditures, Statistical Bulletin 702, ERS, USDA.

Farm-retail price spreads

	Annual			1983						1984
	1981	1982	1983	Jan	Aug	Sept	Oct	Nov	Dec	Jan

*February 13, 1983 Supply and Demand Estimates. ¹Marketing year beginning June 1 for wheat, barley, and oats, August 1 for cotton and rice, September 1 for soybeans, and October 1 for corn, sorghum, soybean meal, and soybean oil. ²Includes imports. ³Season average. ⁴Includes seed. ⁵Upland and extra long staple. Stock estimates based on Census Bureau data which results in an unaccounted difference between supply and use estimates and changes in ending stocks. ⁶Conversion factors: Hectare (ha.) = 2.471 acres, 1 metric ton = 2,204.622 pounds, 36.7437 bushels of wheat or soybeans, 39.3679 bushels of corn or sorghum, 49.9296 bushels of barley, 69.8944 bushels of oats, 22.046 cwt. of rice, and 4.59 480-pound bales of cotton. ⁷Statistical discrepancy.
